

System Features

- Unique access port secures implant to inserter ensuring controlled device placement and allows *In situ* delivery of optimal bone graft volume
- Larger graft chamber allows greater volume of bone graft material promoting a more robust fusion column
- Larger load-bearing surface area maintains disc height and reduces risk of subsidence
- Bulleted nose provides ease of insertion and precise placement for challenging disc conditions
- Implant size matrix addresses unique patient anatomy with lengths ranging from 30mm to 60mm, heights ranging from 8mm to 14mm, widths of 18mm, 21mm and 24mm, and lordotic angles of 0°, 7°, 10° and 13°
- Comprehensive instrumentation, including angled instruments and a variety of handles

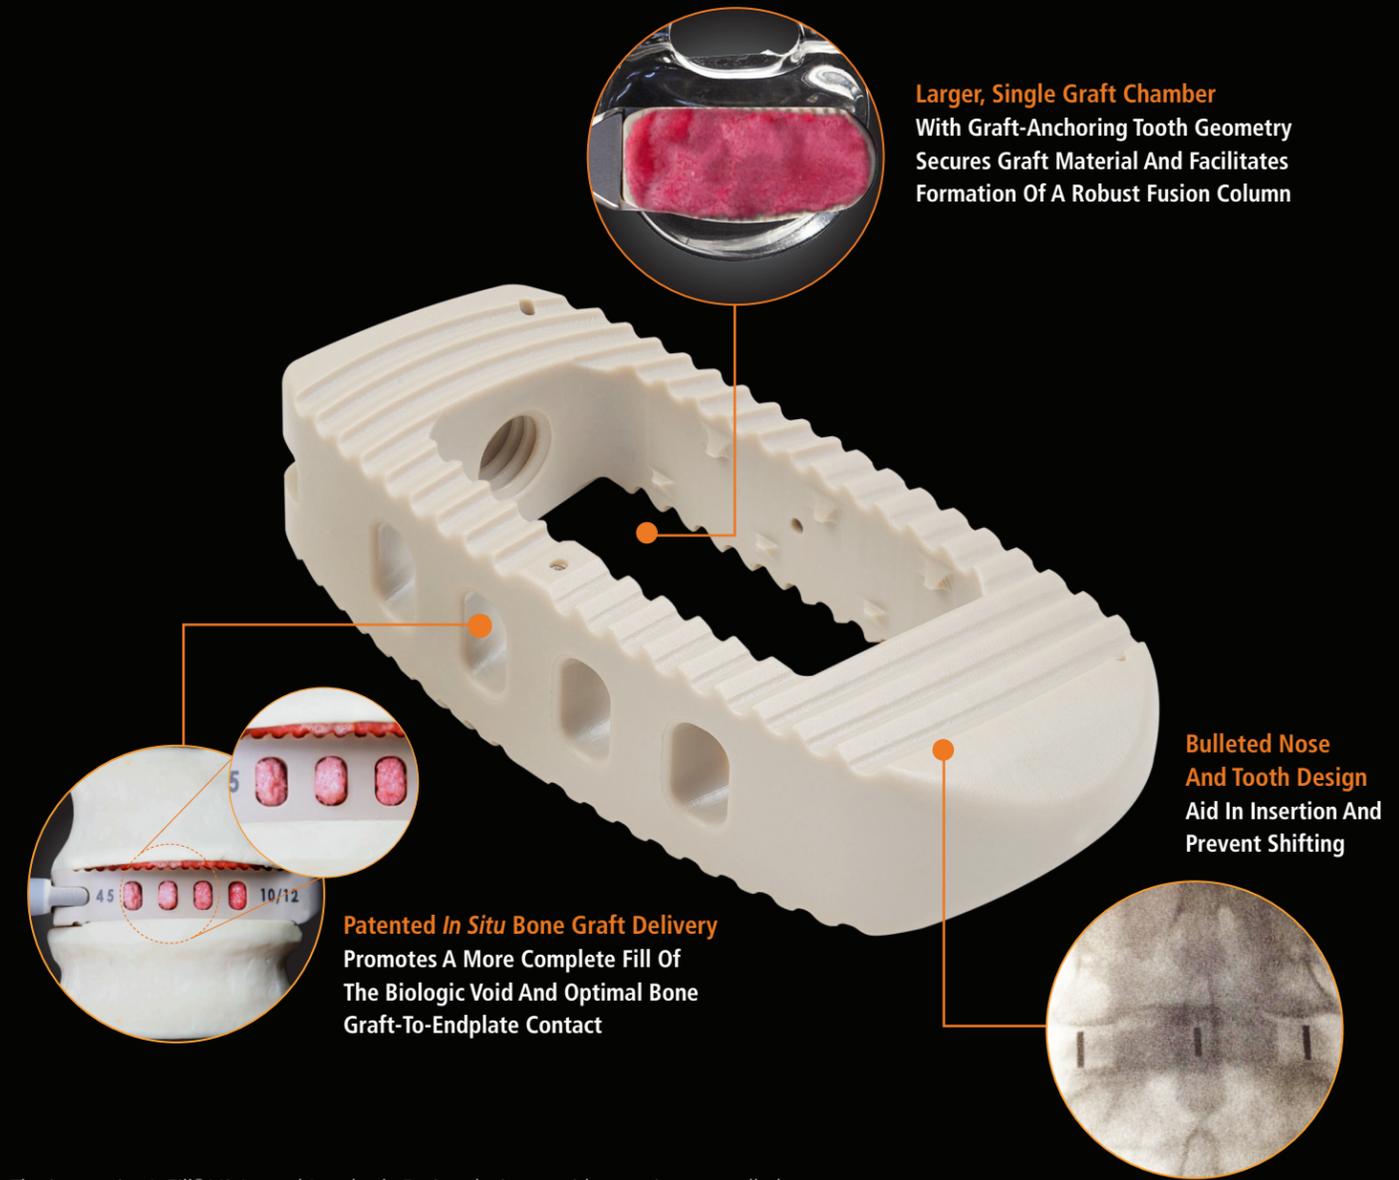

Straight and Angled Instrumentation

Inside Out Thinking

Eliminate The Performance Gap

Larger, Single Graft Chamber
With Graft-Anchoring Tooth Geometry
Secures Graft Material And Facilitates
Formation Of A Robust Fusion Column

**Bulleted Nose
And Tooth Design**
Aid In Insertion And
Prevent Shifting

Patented *In Situ* Bone Graft Delivery
Promotes A More Complete Fill Of
The Biologic Void And Optimal Bone
Graft-To-Endplate Contact

The innovative InFill® V2 Lateral Interbody Fusion device provides precise, controlled delivery of graft material *in situ*, for ensuring optimal graft volume and endplate contact. Coupled with a larger, single graft chamber and large, load-bearing surface area, the InFill V2 Lateral Implant restores and maintains disc height, and facilitates formation of a robust fusion column.

Eliminate The Performance Gap With The InFill V2 Lateral Interbody Fusion System

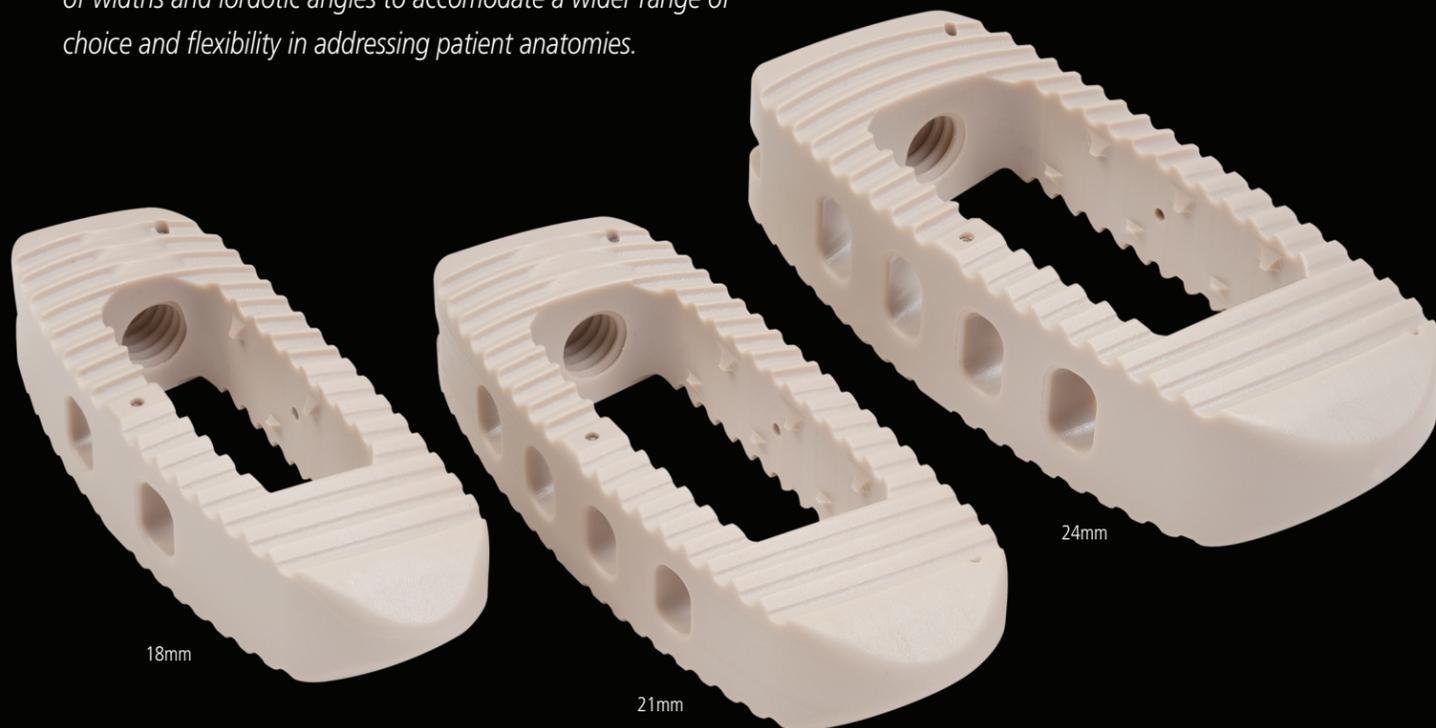

Science has shown that in many unilateral posterior lumbar interbody fusion procedures, less than 50% of the disc area is actually grafted.* Close the performance gap with confidence, with the only patented Interbody Fusion System designed to deliver optimized graft-to-endplate contact.
